Status of Claims

In view of the Appeal Brief filed on 28 April 2003, PROSECUTION IS
 HEREBY REOPENED. New grounds of rejection are set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

- (1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,
 - (2) request reinstatement of the appeal.

If reinstatement of the appeal is requested, such request must be accompanied by a supplemental appeal brief, but no new amendments, affidavits (37 CFR 1.130, 1.131 or 1.132) or other evidence are permitted. See 37 CFR 1.193(b)(2).

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 3621

3. Claims 1-4, 9-12, 17-23, and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Newton et al., U.S. Patent No. 5,771,291 in view of Solokl et al., U.S. Patent No. 6,173,269.

As per claims 1-4, 9-12, 17-23, and 25, Solokl et al. teach a system for providing financial resources over a network comprising: a network access device with a browser for interfacing with a public network (figure 1; column 4. lines 13-29) that is connected to an authentication processor over the public network (figure 1; column 4, lines 13-29), the processor in turn connected to a financial institution over a private network and determining access to a user financial account using said private network (figure 2). Solokl et al. teach a user logging onto an account (figure 2; column 7, lines 65-66). To one of ordinary skill. it would have been obvious to have a user provide a first identifier, such as a user name or ID, in order to login. Along with the login procedure, Solokl et al. also teach transferring an authentication parameter to an authentication processor. Solokl et al. do not specifically recite a portable storage medium with encrypted and unencrypted information. Newton et al. teach a system for authenticating users who desire to access remote resources using a network access device that includes a programmable controller for executing code and a memory for interfacing with a public network (figure 1; column 3, lines 17-35) comprising a computer readable portable storage medium (e.g. CD-ROM) having encrypted and unencrypted information (column 6, lines 33-38; column 7, lines 45-55). Newton et al. teach an authentication processor, such as a decryption

Art Unit: 3621

processor connected to the public network (column 7, lines 45-55) for decrypting encrypted information to determine access to remote resources (column 7, lines 53-61). Newton et al. also teach a computer host connected to the network access device over the public network that transfers an active module to the network access device (column 6, lines 10-15; column 7, lines 50-53) that demands a user provide an identifier such as a password or user ID in order to access a network (column 6, lines 10-15). Therefore, it would have been obvious to one of ordinary skill to combine the systems of Solokl et al. and Newton et al. in order to improve network security by allowing users to enter longer, and hence more secure, identification codes and providing an efficient means for entering the code ('291, figure 1; column 8, lines 20-29).

4. Claims 5-8 are rejected under 35 U.S.C. 103(a) as being unpatentable over Newton et al., U.S. Patent No. 5,771,291 and Solokl et al., U.S. Patent No. 6,173,269 as applied to claim 4 above, and further in view of Bocinsky Jr., U.S. Patent No. 5,371,797.

As per claims 5-8, Solokl et al. teach a user logging onto or gaining entrance to multiple networks (figure 2). Solokl et al. also teach displaying data to a user upon successful authentication (figure 2). Newton et al. teach a secure method for logging onto a network using authentication/identifier data such as encrypted identification keys, passwords and IDs (column 6, lines 10-15; column

Art Unit: 3621

7, lines 45-61). Newton et al. also teach that a host computer has access to a database containing encryption and identification keys that are to be stored on a CD-ROM (column 4, lines 50-52). However, neither Solokl et al. nor Newton et al. specifically recite re-encrypting identifiers. Bocinsky Jr. teaches a system for passing financial data across multiple networks, using a network switch to route data, for securing electronic transactions comprising decrypting an identifier and re-encrypting the identifier prior to sending the identifier across another network (figure 1; column 8, lines 19-25; column/line 9/54-10/41; column 13, lines 30-55). Bocinsky Jr. also teaches financial data as an identifier for determining access to a financial account (column/line 1/15-2/60; column 14, lines 12-20) and a financial institution generating a code reflecting whether or not access has been approved, and transferring the code to a decryption processor (figure 2; column 13, lines 30-55). Regarding the production of the portable storage medium, it would have been obvious to one of ordinary skill to manufacture the CD-ROM using any facility that creates CD-ROMs or other portable storage mediums for storing encrypted information, using an encryption module, and unencrypted information ('291, column 7, lines 45-50). Therefore, it would have been obvious to one of ordinary skill to combine the teachings of Solokl et al., Newton et al., and Bocinsky Jr. in order to provide a more secure system by encrypting sensitive data as it travels across vulnerable networks.

Art Unit: 3621

Claims 14-16 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Newton et al., U.S. Patent No. 5,771,291 and Solokl et al.,
 U.S. Patent No. 6,173,269 as applied to claims 12 and 23 above, and further in view of Campbell U.S. Patent No. 4,259,720.

As per claims 14-16 and 24, Solokl et al. teach a user logging onto or gaining entrance to multiple networks and stored identifiers that pertain to customers and financial institutions, such as PINs and Bank IDs (figure 2). Solokl et al. also teach displaying data to a user upon successful authentication (figure 2). Newton et al. teach a secure method for logging onto a network using authentication/identifier data such as encrypted identification keys, passwords and IDs (column 6, lines 10-15; column 7, lines 45-61). Newton et al. also teach that a host computer has access to a database containing encryption and identification keys that are to be stored on a CD-ROM (column 4, lines 50-52). However, neither Solokl et al. nor Newton et al. specifically recite storing encrypted data at the producer of a portable storage medium that maintains encrypted and unencrypted data. Campbell teaches storing secret identification data in encrypted form (abstract). Regarding the production of the portable storage medium, it would have been obvious to one of ordinary skill to manufacture the CD-ROM using any facility that creates CD-ROMs or other portable storage mediums for storing encrypted information, using an encryption module, and unencrypted information ('291, column 7, lines 45-50; 720, column

Art Unit: 3621

3, lines 35-64). Therefore, it would have been obvious to one of ordinary skill to combine the teachings of Solokl et al., Newton et al. and Campbell in order to prevent unauthorized access of the stored secret identification codes ('291, abstract; '720, column 1, lines 32-50).

Conclusion

6. Any inquiry concerning this communication or earlier communications from the Examiner should be directed to Calvin Loyd Hewitt II whose telephone number is (703) 308-8057. The Examiner can normally be reached on Monday-Friday from 8:30 AM-5:00 PM.

If attempts to reach the Examiner by telephone are unsuccessful, the Examiner's supervisor, James P. Trammell, can be reached at (703) 305-9768.

Any response to this action should be mailed to:

Commissioner of Patents and Trademarks

c/o Technology Center 2100

Washington, D.C. 20231

or faxed to:

(703) 305-7687 (for formal communications intended for entry and after-final communications),

or:

Art Unit: 3621

(703) 746-5532 (for informal or draft communications, please label "PROPOSED" or "DRAFT")

Hand-delivered responses should be brought to Crystal Park 5, 2451 Crystal Drive, 7th Floor Receptionist.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist whose telephone number is (703) 308-1113.

Calvin Loyd Hewitt II
